Wireless technology seems like a great idea, the problem is we aren't electrically compatible. Smart Meters, cell phones and Wi-Fi use frequencies that are 900 MHz to 5GHz. That is 900 million cycles per second to 5 billion cycles per second. Towers, their antennas, routers and other wireless infrastructure are bathing areas so we can use wireless. The real problem is there are reasons we wire devices because nothing in existence runs at those frequencies.... The frequencies are illegal as applied. Safety standards only considered tissue was heating, they left out the fact intricate electrical systems are electromagnetically induced. Ohm's law wasn't considered or used and it wasn't understood cell voltages in your body are changed.

The information below is critically important to you. You will read that authors radiated chicken eggs with frequencies and the chickens were mutated as you can see in the pictures.

A smart meter will go on your home and the meters, relays, routers, collectors will radiate a fetus, a baby, a baby girl's eggs 24/7. Chickens hatch in 21 days and the chicks were mutated. Girl's eggs will be radiated for years until they become of age to get pregnant. What will happen to the baby? All of this to read energy consumption remotely and this isn't addressing the problems to buildings, infrastructure, agriculture, fish, trees and literally everything in the coverage area.

Here is a picture from a must read book called "Cellular Radiation, Is This Our Next Titanic?" by Dr. David R. James &

Ora James Murphy. Ph: 1-877-300-4880 Ext 102. Look at the picture and think of your children or wives as well as all life. After mutation, what happens when a species can't reproduce any more?

Respectfully Submitted
May our children be mutation free!
